C. Option B
D. Option A
Answer: A

NEW QUESTION: 2
Which two of these parameters are used to determine a
forwarding equivalence class? (Choose two.
A. BGP MED value
B. RSVP request from CE for bandwidth reservation
C. Layer 2 circuit
D. IP prefix
Answer: C,D
Explanation:
A Forwarding Equivalence Class (FEC) is a class of packets that
should be forwarded in the same manner (i.e. over the same
path). A FEC is not a packet, nor is it a label. A FEC is a
logical entity created by the router to represent a class
(category) of packets. When a packet arrives at the ingress
router of an MPLS domain, the router parses the packet's
headers, and checks to see if the packet matches a known FEC
(class). Once the matching FEC is determined, the path and
outgoing label assigned to that FEC are used to forward the
packet. FECs are typically created based on the IP destinations
known to the router, so for each different destination a router
might create a different FEC, or if a router is doing
aggregation, it might represent multiple destinations with a
single FEC (for example, if those destinations are reachable
through the same immediate next hop anyway). The MPLS
framework, however, allows for the creation of FECs using
advanced criteria like source and destination address pairs,
destination address and TOS, etc.
