#### **NEW QUESTION: 1**

Which software runs on the Exadata Storage Server?

- A. Oracle Enterprise Linux
- B. Enterprise Manager
- C. Restart Server
- D. CELLSRV
- E. IORM

**Answer: A**

Explanation:

Like any storage device the Exadata server is a computer with

CPUs, memory, a bus, disks, NICs, and the other components normally found in a server. It also runs an operating system (OS), which in the case of Exadata is Oracle Enterprise Linux (OEL) 5.3. The Exadata Storage Server Software resident in the Exadata cell runs under OEL. OEL is accessible in a restricted mode to administer and manage the Exadata cell.

**NEW QUESTION: 3**

Which of the following test makes sure the modified or new system includes appropriate access controls and does not introduce any security holes that might compromise other systems?

- A. Security testing
- B. Stress/volume testing
- C. Interface testing
- D. Recovery testing

**Answer: A**

Explanation:

Explanation/Reference:

Explanation:

Security testing tests all security mechanisms and features within a system to determine the level of protection they provide. Security testing can include authorization testing, penetration testing, formal design and implementation

verification, and functional testing.

Authorization testing is the process of determining that a requester is allowed to receive a service or perform an operation. Access control is an example of authorization.

Incorrect Answers:

A: Recovery testing is the activity of testing how well an application is able to recover from crashes, hardware failures and other similar problems. Recovery testing does not test access control and does not find any security holes.

C: Stress testing is a form of deliberately intense or thorough testing used to determine the stability of a given system or entity. It involves testing beyond normal operational capacity, often to a breaking point, in order to observe the results. Stress testing does not test access control and does not find any security holes.

D: Interface testing can be used to check the handling of data passed between various units, or subsystem components, beyond full integration testing between those units. Interface testing does not test access control and does not find any security holes.
